

New GSM Intercom

Access control and alarm system

The New WT-9002 is a Quad Band GSM communicator that comes as a universal interface or complete with it's own Stainless Steel external Call Point and has been designed and developed to eliminate the need for any direct wiring from the Gate position into the owners property. In fact as long as there is GSM service distance is no problem, the call can be answered by mobile phone wherever the user has mobile phone service.

The system will call the numbers programmed regardless of the location of the telephone being called and also has the Dial2Open GSM Remote control system built in as well to provide a more flexible and convenient solution to access control .

The Call-Point when paged will communicate with the Main Control system which can call up to 3 Mobile Phone or Land Line Numbers in the order they were programmed into the system.

Once the main Control system has located a telephone number which has responded by answering the call, the visitor at the gate and the person called can have a normal two way conversation voice communication

When the Caller has established that the visitor is to be allowed access the all the owner has to do is to key in 3 simple prompts on the keypad of the Mobile or Landline Telephone Handset and the Gates or door will open.

It is as simple as that!
